Optimizing the Safe Performance of EHRs

David C Classen MD MS
University of Utah
June 2016
A Patient Safety Case in The HIT Era

• 69 year old women admitted for elective colon resection for diverticuli

• 2 days post op she develops pneumonia and is transferred to the ICU

• On the second ICU day the patient suffers a prolonged period of unrecognized hypotension and is ultimately found to be septic and ultimately dies

• On review of the case a malfunction in the bedside monitor/EHR Interface led to an inaccurate blood pressure reading in the EHR blood pressure display
A Patient Safety Case in The HIT Era

• 27 year old women evaluated in the ER for severe lower abdominal pain

• Taken to surgery for what was felt to be an acute abdomen

• At surgery she was found to be pregnant and the fetus did not survive

• On review of the case a problem with interoperability lead to another patients lower abdominal ultrasound report being inadvertently inserted into this patients EHR record

High Rates of Adverse Drug Events in a Highly Computerized Hospital

Jonathan R. Neberker, MS, MD; Jennifer M. Hoffman, PharmD; Charlene R. Weir, RN, PhD; Charles L. Bennett, MD, PhD, MPP; John F. Hurdle, MD, PhD

Background: Numerous studies have shown that specific computerized interventions may reduce medication errors, but few have examined adverse drug events (ADEs) across all stages of the computerized medication process. We describe the frequency and type of inpatient ADEs that occurred following the adoption of multiple computerized medication ordering and administration systems, including computerized physician order entry (CPOE).

Methods: Using explicit standardized criteria, pharmacists classified inpatient ADEs from prospective daily reviews of electronic medical records from a random sample of all admissions during a 20-week period at a Veterans Administration hospital. We analyzed ADEs that necessitated a changed treatment plan.

Results: Among 937 hospital admissions, 483 clinically significant inpatient ADEs were identified, accounting for 52 ADEs per 100 admissions and an incidence density of 70 ADEs per 1000 patient-days. One quarter of the hospitalizations had at least 1 ADE. Of all ADEs, 9% resulted in serious harm, 22% in additional monitoring and interventions, 32% in interventions alone, and 11% in monitoring alone; 27% should have resulted in additional interventions or monitoring. Medication errors contributed to 27% of these ADEs. Errors associated with ADEs occurred in the following stages: 61% ordering, 25% monitoring, 13% administration, 1% dispensing, and 0% transcription. The medical record reflected recognition of 76% of the ADEs.

Conclusions: High rates of ADEs may continue to occur after implementation of CPOE and related computerized medication systems that lack decision support for drug selection, dosing, and monitoring.

Recommendation 1 (continued)

b. The Office of the National Coordinator for Health IT (ONC) should expand its funding of processes that promote safety that should be followed in the development of health IT products, including standardized testing procedures to be used by manufacturers and health care organizations to assess the safety of health IT products.

c. ONC and AHRQ should work with health IT vendors and health care organizations to promote post-deployment safety testing of EHRs for high prevalence, high impact EHR-related patient safety risks.

d. Health care accrediting organizations should adopt criteria relating to EHR safety.

e. AHRQ should fund the development of new methods for measuring the impact of health IT on safety using data from EHRs.

Recommended Practice

22. CPOE and CDS functionality are tested to ensure proper operation before go-live and with test patients in the production system before clinical use.

Implementation Status

Off

Principle: Complete/Correct EHR Use

Rationale for Practice or Risk Assessment

Appropriate testing reduces the risk of errors associated with inappropriate CDS or CPOE system behavior.

Suggested Sources of Input

Clinicians, support staff, and clinical administration

EHR developer

Health IT support staff

Examples of Potentially Useful Practices/Scenarios:

- The Leap Frog test is taken to ensure the safety of CDS.
- CDS interventions are evaluated to ensure correct firing of alerts and reminders.

Follow-up Actions

SAFE PRACTICE 16: SAFE ADOPTION OF COMPUTERIZED PRESCRIBER ORDER ENTRY

The Objective
Promote the safe use of medications, tests, and procedures through the successful implementation of integrated clinical information technologies that reduce preventable harm to patients.

The Problem
Medical errors related to medication and other clinical ordering errors are common. The majority of such events are preventable. In 2006, the Institute of Medicine (IOM) estimated that 400,000 preventable drug-related injuries occur in hospitals and that an additional 800,000 injuries occur in long-term care settings each year. [IOM, 2007]

The frequency of such errors is alarming: More than 500,000 Medicare recipients experience a medication-related injury during visits to outpatient clinics each year. A recent study estimated that 1 of every 10 adult patients suffers a serious medication-related adverse event. [Adams, 2008] The rate for pediatric patients is estimated to be three times higher than the rate for adults. [Kaushal, 2001]
CPOE may be adopted with a stage approach once integrated information systems are in place to support safety and effective CPOE systems...

The CPOE system is tested against The AHRQ/NQF Inpatient CPOE Testing Standards...developed to provide organizations that are implementing CPOE with appropriate decision support about...
“Anyone here know how to play Microsoft’s Flight Simulator?”
Principles Behind the Evaluation Methodology

- **Principle #1: Target the Harm**
  - Common sources of ADE’s (not errors)
  - Sources of severe harm (existing literature and expert consensus)

- **Principle #2: Encourage Quality Improvement**
  - Categorize test set by type of error
  - Provide feedback to the provider organization for each category
  - Provide advice about nuisance alerting

- **Principle #3: Accentuate the positive**
  - Encourage quality, as well as harm reduction (ADE’s)
    - Address errors of commission and omission
    - Include corollary orders and duplicate interventions
Relationship between medication event rates and the Leapfrog computerized physician order entry evaluation tool

Alexander A Leung, Carol Keohane, Stuart Lipsitz, Eyal Zimlichman, Mary Amato, Steven R Simon, Michael Coffey, Nathan Kaufman, Bismarck Cadet, Gordon Schiff, Diane L Seger, David W Bates

ABSTRACT

Objective. The Leapfrog CPOE evaluation tool has been promoted as a means of monitoring computerized physician order entry (CPOE). We sought to determine the relationship between Leapfrog scores and the rates of preventable adverse drug events (ADE) and potential ADE.

Materials and methods. A cross-sectional study of 1000 adult admissions in five community hospitals from October 1, 2008 to September 30, 2010 was performed. Observed rates of preventable ADE and potential ADE were compared with scores reported by the Leapfrog CPOE evaluation tool. The primary outcome was the rate of preventable ADE and the secondary outcome was the composite rate of preventable ADE and potential ADE.

Results. Leapfrog performance scores were highly related to the primary outcome. A 43% relative reduction in the rate of preventable ADE was predicted for every 5% increase in Leapfrog scores (rate ratio 0.57; 95% CI 0.37 to 0.88). In absolute terms, four fewer preventable ADE per 100 admissions were predicted for every 5% increase in overall Leapfrog scores (rate difference -4.2; 95% CI -7.4 to -1.1). A statistically significant relationship between Leapfrog scores and the secondary outcome, however, was not detected.

Discussion. Our findings support the use of the Leapfrog tool as a means of evaluating and monitoring CPOE performance after implementation, as addressed by current certification standards.

Conclusions. Scores from the Leapfrog CPOE evaluation tool closely relate to actual rates of preventable ADE. Leapfrog testing may alert providers to potential vulnerabilities and highlight areas for further improvement.

in the rates of preventable ADE and potential ADE—is an arduous and expensive process. Therefore, for practical reasons, most hospitals seeking to evaluate the effectiveness of a CPOE system are limited to indirect, surrogate measures.

To this effect, the Leapfrog Group has developed an independent, inexpensive, and standardized tool for assessing the performance of a hospital's CPOE system by using simulation cases. In essence, the Leapfrog CPOE evaluation tool estimates the potential benefit of a CPOE system by testing how it handles a variety of dangerous medication ordering scenarios. Accordingly, performance scores are presumed to be linked to actual outcomes.

Objective

The Leapfrog CPOE evaluation tool, presently the only instrument of its kind, has been quickly adopted into practice for monitoring purposes. However, it still remains uncertain whether Leapfrog performance scores are related to outcomes in real-world settings as empirical evidence is currently lacking. Addressing this evidence gap, we sought to determine the relationship between test scores and actual rates of preventable ADE and potential ADE.

MATERIALS AND METHODS

We performed a cross-sectional study to compare the rates of preventable ADE and potential ADE with scores reported by the Leapfrog CPOE evaluation tool. This study was conducted independently of the Leapfrog Group and was approved by the institutional review boards at each hospital site.
Many Research Databases Used

Research background, combined with the practical experience of the EHR pioneers, was first used to define the focus.

Simulations of EHR Use with CPOE

The assessment pairs medication orders that would cause a serious adverse drug event with a fictitious patient.

A physician enters the order …

Patient AB

Female
52 years old
Weighs 60 kg
Allergy to morphine
Normal creatinine

and observes and records the type of CDS-generated advice that is given (if any).

Coumadin (Warfarin) 5 mg po three times a day.
Web-Based Evaluation Tool (cont.)

- For ambulatory test: additional capability to test basic health maintenance prompting

- Outputs received immediately after submitting results
  - Individual site performance feedback
    - Indicating performance in each medication order category
    - Indicating performance for health maintenance (ambulatory only)
      - Sensitivity = the ones that you got right (percentage)
      - Specificity = how many did you get that you should not have (percentage)
  - Aggregate score for public reporting - similar to the Leapfrog Hospital Quality and Safety Survey
Web-Based Evaluation Tool

1. Hospital Logs - On (Password Access)
2. Complete Sample Test
3. Obtain Patient Criteria (Adult or Pediatric)
4. Program Patient Criteria
5. Download and Print 30 - 40 Test Orders (HM if AMB)
6. Enter Orders into CPOE Application & Record Results

- Review Orders and Categories
- Review Patient Descriptions
- Review Scoring
- Aggregate Score to Leapfrog
- Order Category Scores Viewed by Hospital

Focus on Quality

By Jane Metzger, Emily Welebob, David W. Bates, Stuart Lipsitz, and David C. Classen

Mixed Results In The Safety Performance Of Computerized Physician Order Entry

Abstract Computerized physician order entry is a required feature for hospitals seeking to demonstrate meaningful use of electronic medical record systems and qualify for federal financial incentives. A national sample of sixty-two hospitals voluntarily used a simulation tool designed to assess how well safety decision support worked when applied to medication orders in computerized order entry. The simulation detected only 53 percent of the medication orders that would have resulted in fatalities and 10–82 percent of the test orders that would have caused serious adverse drug events. It is important to ascertain whether actual implementations of computerized physician order entry are achieving goals such as improved patient safety.

Many people have suggested that electronic health records represent essential infrastructure for the provision of safe health care in the United States. For several years, the Institute of Medicine, the Leapfrog Group, the National Quality

In this application of clinical decision support, physicians are made aware of potential safety issues that can result—for example, when ampicillin is given to a patient with a known allergy to penicillin, or the dose being ordered for a pediatric patient is much higher than the therapeutic range for a child of this age and weight.
